# What is Economic Complexity?

Economic complexity is the application of **complex systems** and **network thinking** to economics

Paradigm shift from *isolated characteristics* to **systemic interactions**

-> To understand emerging patterns of growth, regional evolution, technological change, inequality, sustainability...

Economic complexity produces useful **heuristics** and **metrics** to make better business and policy decisions

## SCIENCE, RESEARCH AND INNOVATION PERFORMANCE OF THE EU 2022

Building  
a sustainable future  
in uncertain times

# Transition to system thinking

Key **concepts** of interdependencies, non-linearity, feedback loops, self-organization, second-order effects, randomness, scaling, fat-tails, network effects, path-dependence...

- Industry 5.0, a transformative vision for Europe : governing **systemic transformations** towards a sustainable industry
- Global value chains : harnessing innovation to protect and transform the **backbone** of global trade
- Protect, prepare and transform Europe - Recovery and **resilience** post COVID-19

# EconX & growth

Economic **development** from a complex systems perspective

As the economy becomes more complex, it **grows**

New technologies and globalization allow for a deeper **division of knowledge**

Trade and division of labor and this is a very **efficient** way to organize the economy

# Yes, But!

Increasing complexity creates an **overload** of information and noise

This **division** of knowledge also creates room for **hierarchy** and **inequality**

Complexity makes key resources very, very **concentrated** (hello network effects)

Increased **interdependencies** make us more vulnerable to pandemics such as Covid-19, financial, and ecological crises

# Complex systems are highly unequal

A complex network graph visualization with many nodes and edges, showing a highly unequal distribution of connections. The nodes are represented by small dots, and the edges are thin lines connecting them. The network is dense and interconnected, with a few central nodes having many more connections than the peripheral nodes. The colors of the nodes and edges range from red to yellow, with the most connected nodes appearing brighter yellow.

*More complex societies are more unequal because large networks create extreme leverage*

# On smart specialization

## Smart specialisation

Smart specialisation is a new innovation policy concept designed to promote the efficient and effective use of public investment in research. Its goal is to boost regional innovation in order to achieve economic growth and prosperity, by enabling regions to focus on their strengths. Smart specialisation understands that spreading investment too thinly across several frontier technology fields risks limiting the impact in any one area.

A smart specialisation strategy needs to be built on a sound analysis of regional assets and technology. It should also include an analysis of potential partners in other regions and avoid unnecessary duplication. Smart specialisation needs to be based on a strong partnership between businesses, public entities and knowledge institutions – such partnerships are recognised as essential for success.

To push forward the smart specialisation concept, the Commission announced the setting up of the S<sup>3</sup>Platform in a 2010 Communication entitled 'Regional Policy contributing to smart growth in Europe 2020'. This platform aims to assist regions and Member States in developing, implementing and reviewing regional smart specialisation strategies, and help regions identify high-value added activities which offer the best chances of strengthening their competitiveness.

# Applied AI for innovation policy

Recommender systems are the most successful application of AI in the business world. They are all about **filtering** massive amount of data (content-based filtering & collaborative filtering)

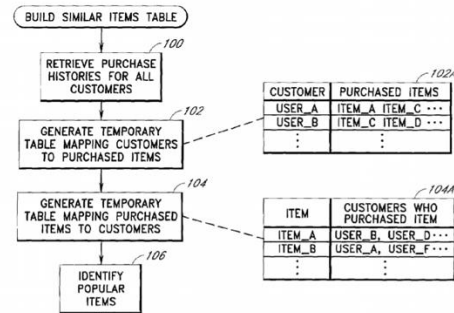

Economic complexity tools are based on **similar machine learning algorithms**

→ **Can support innovation policy & smart R&I investments**

# Matching products and customers

U.S. Patent Sep. 26, 2006 Sheet 3 of 7 US 7,113,917 B2

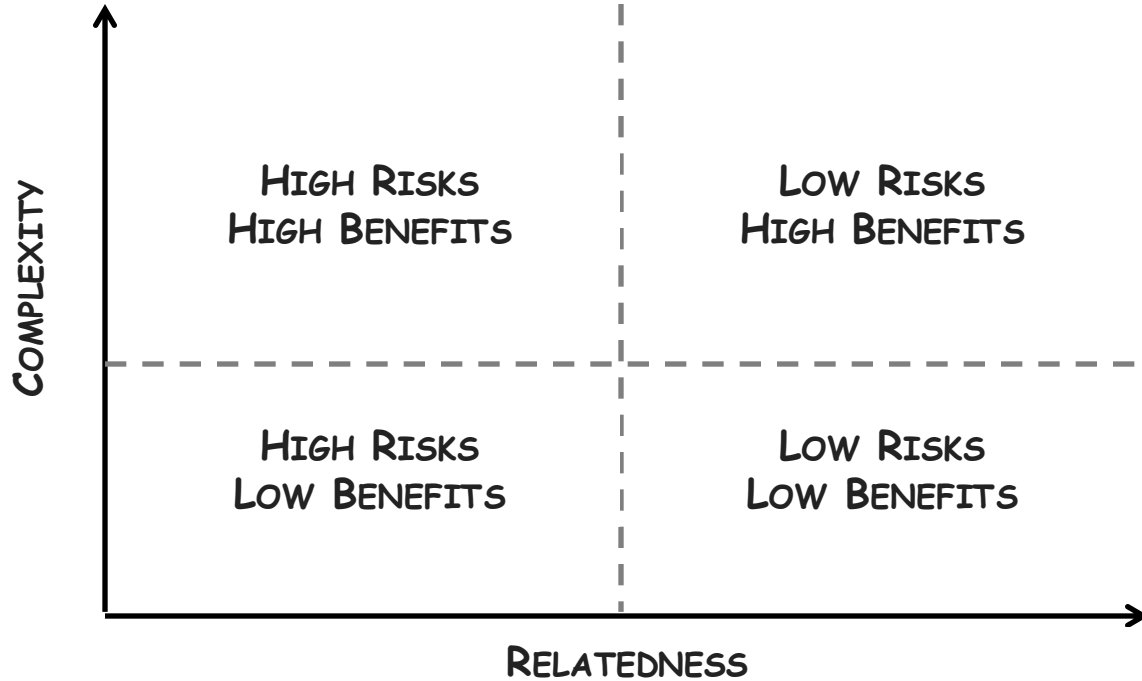

Modern **AI** techniques extract information from network structures
